

# BREAKDOWN TIMES

## 5. Describing the Breakdown Times

SPSS produces the following tables of descriptive statistics for the breakdown times of the seven experimental groups:

As we expected, breakdown times tend to decrease as the voltage increases. However, the breakdown times decrease exponentially. Mean time until breakdown was longest for the 26 kV group 1 (1303.003), and shortest for the 38 kV group (0.916). Median time until

breakdown follows the same pattern. The longest breakdown time was for a batch from the 26 kV group (2323.70).

The variability in each group changes as the voltage level increases. The standard deviation decreases as the voltage level increases, it is very large for low voltages and relatively small for high voltages.
